

Join us for a presentation of the PsySTART Disaster Triage System

February 24, 2016: 11:00am-12:00pm (MST)

[Register for the webinar here](#)

* Access is limited to the first 100 callers. Please use shared access when possible.

Target Audience: Behavioral health providers, public health and healthcare preparedness professionals, first responders, emergency managers, MRC unit leaders, and others who work to meet the needs of traumatized citizens in a disaster.

About PsySTART: PsySTART is a strategy for rapid mental health triage during small- and large-scale disasters and terrorism events. It has two systems, one for victims and one for responders.

PsySTART is a widely used, evidence-based, disaster mental health triage system that can help responders rapidly assess and provide for any surge in acute and longer-term mental health impacts after disasters.

PsySTART has three components:

- Community resilience via linkage between community “disaster systems of care”
- An evidence-based triage designed for field use by responders without mental health expertise
- An information technology platform to manage the collection & analysis of triage needs in near real time

About the presenter: Dr. Merritt Schreiber developed PsySTART. He is Associate Clinical Professor and Director of Psychological Programs in the Center for Disaster Medicine, University of California. He is involved in the development of best practice models bridging disaster medical, mental and public health in mass casualty events.
